

### Passing arguments to programs

- Most programs use arguments:  
`regress life_expectancy income`
- Here, `regress` is the *programe*, and `life_expectancy` and `income` are the arguments
- The arguments are passed to the program with locals

Local	Content
<code>`0'</code>	Exactly what was typed, including typed blanks etc.
<code>`1'</code>	The first argument
<code>`2'</code>	The second argument
<code>`*'</code>	All arguments without double quotes and with proper blanks

- The arguments can also be named using `args`
